IMT 2026 · Growth Modeling & Data-Driven Strategy · Final project

# FitLoop

Is FitLoop's growth healthy, and where should the next euro go?

Group [nº] · [Name 1] · [Name 2] · [Name 3] · [Name 4]

Our answer

# Only partly healthy: re-allocate the budget, don't double it

**×1.7**

**Monthly signups**

From about 2,600 to 4,600 a month in 18 months

**8 in 10**

**Signups are paid for**

TikTok, Meta, Google and Influencers ads

**€1.59**

**Per extra € if we double**

Lifetime value of each extra euro in the CEO's plan

**+201**

**Payers per quarter, €0 extra**

TikTok budget to Google + activation +4 pts

**Recommendation**

Move TikTok's budget to Google Ads, invest in the first week of each new user, and steer the company by the number of new users who complete 3 workouts in 7 days.

01 · Data quality

# Before any metric: 70,851 raw rows → 70,237 real users

**562**

### Duplicate rows removed

Exact copies of the same user row

**45**

### QA test accounts removed

Channel 'internal', IDs starting with QA_: trial and payment on the same day

**7**

### Impossible dates removed

Signups dated 1900, 1970 or 2099

**11 → 6**

### Channel labels merged

tiktok, meta_ads, Facebook Ads and google_ads joined to their channel

**827**

### Users kept, out of CAC

Meta Ads spend for Aug 2025 is missing: counting them would make Meta look cheaper

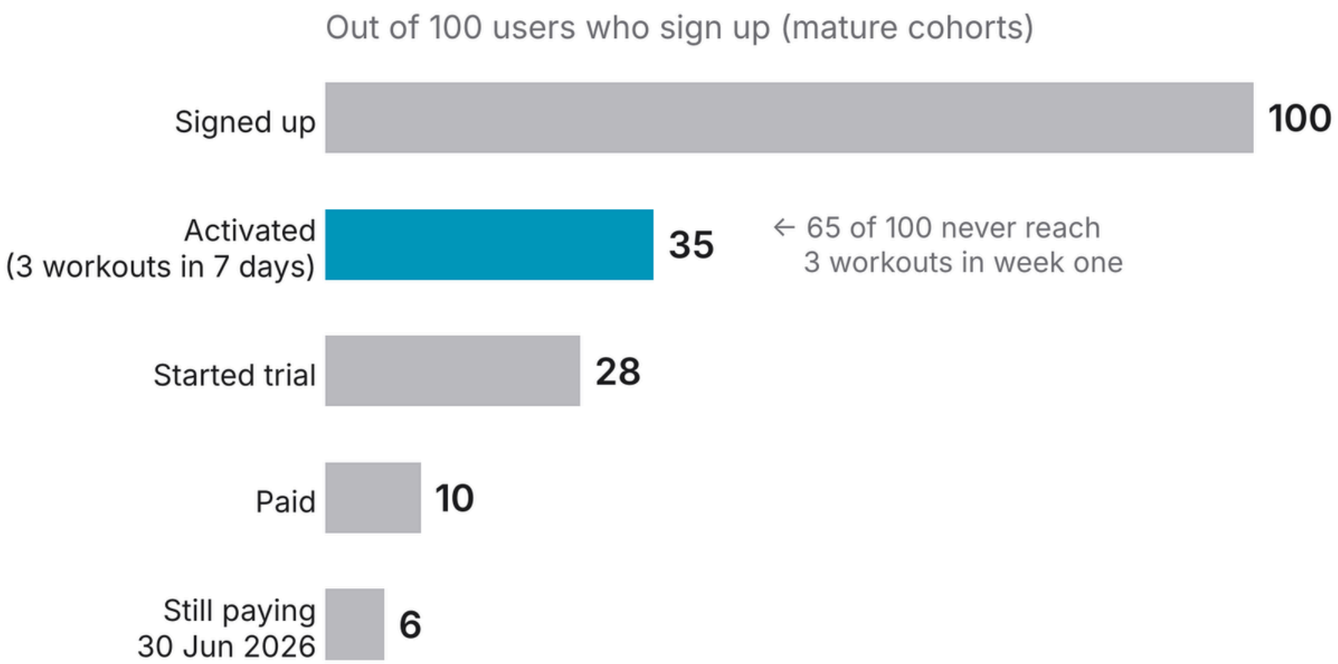

**1,494**

### Countries set to Unknown

About 2% of users, kept in every analysis

Every rule and the number of rows it affects is in the cleaning log of the report. After cleaning, every payer pays exactly 7 days after the trial starts, as the brief says.

# The biggest leak is the first week

**17×**

**More likely to pay if activated**

26.2% of users who do 3 workouts in 7 days pay, vs 1.6% of the others

**37%**

**Of trials become paid**

Flat for 18 months: the trial step never improved

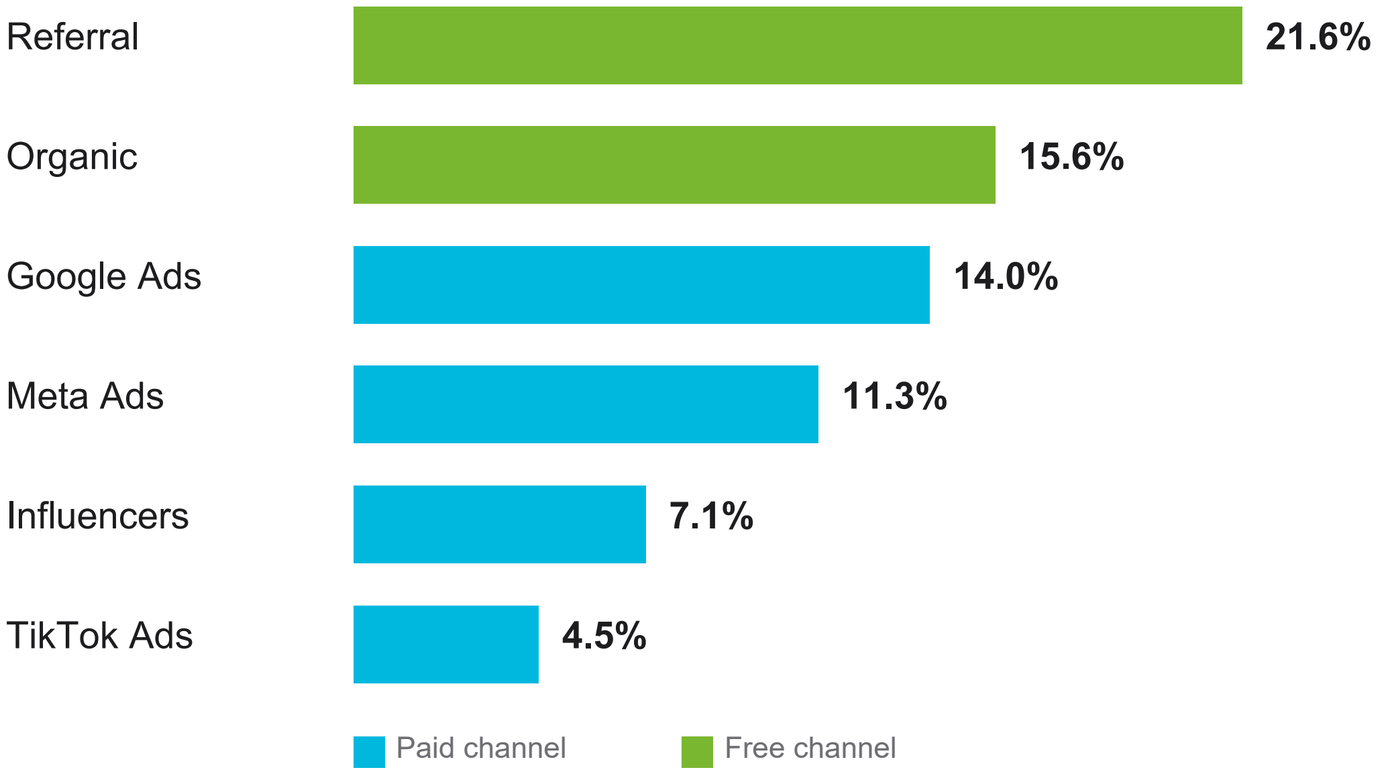

**1 in 3**

**Payers had already left**

Of 10 payers per 100 signups, about 4 had cancelled by 30 June 2026

# Where users come from matters, and it holds like-for-like

Share of signups who end up paying (mature users)

## Same ranking on iOS and Android

TikTok pays 4.7% on Android and 4.1% on iOS. The phone is not the problem.

## Same ranking before and after Oct 2025

Every channel improved after the change, but the order did not move.

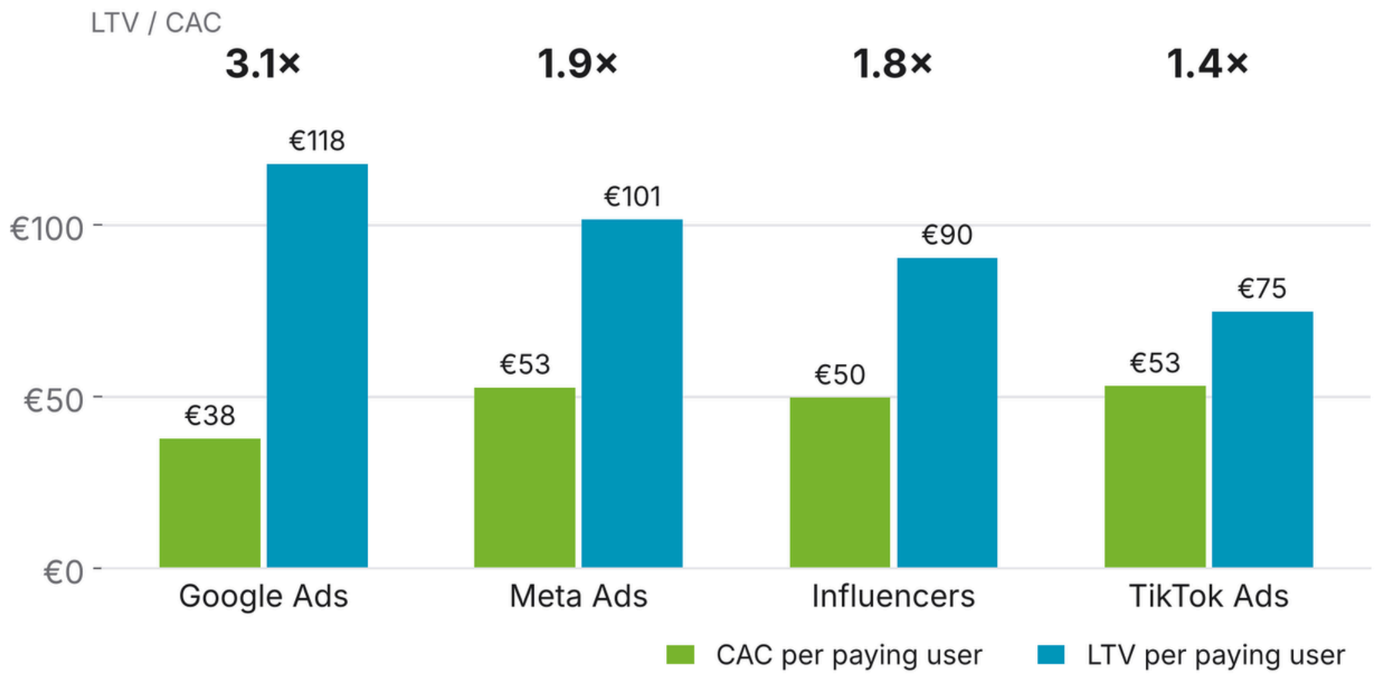

## iOS only looks better

TikTok users are 78% Android. Inside each channel, iOS and Android pay the same.

## Country makes no difference

FR, BE, CH and LU all convert at about 10%.

# TikTok: the cheapest signups, the most expensive customers

CAC per payer = ad spend ÷ paying users (Meta Aug 2025 excluded). LTV = €9.99 ÷ monthly churn on the monthly plan, €59.99 ÷ (1 − 54% renewal) on the annual plan, mixed by plan share. Revenue only: no cost data.

## €2.40 → €53

**TikTok: cheapest signup, priciest payer**

Few TikTok users pay, so each paying user costs the most

## 17.5% vs 7%

**Monthly churn, TikTok vs Referral**

A TikTok subscriber stays about 6 months, a referral about 14

## 46%

**Of the €229,760 budget went to Meta**

Meta returns €1.9 per €1; Google €3.1, paid back in 4.3 months

# Four changes in 18 months; the one that worked was product

**Mar 2025**

### Influencer bursts

€9,000 each (again Sep 2025 and Feb 2026): about 2,500 signups per burst, but only 7% pay.

**Jun 2025**

### TikTok launches

Many new signups, few activate: average activation falls from 35% to 26%.

**Sep 2025**

### Meta spend ramps up

Monthly Meta spend nearly triples, and each new Meta user costs about 40% more.

**1 Oct 2025**

### Activation jumps

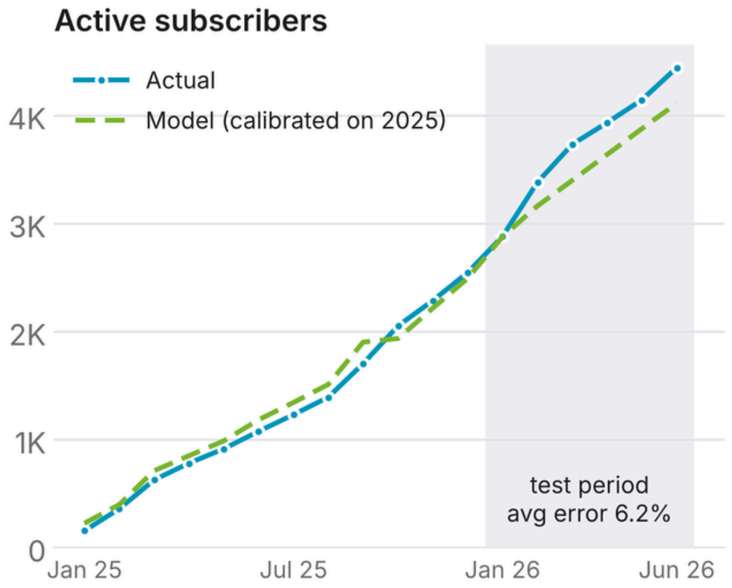

From 26% to 40% overnight, in every channel. Signup → paid rises from 8.6% to 11.4%.

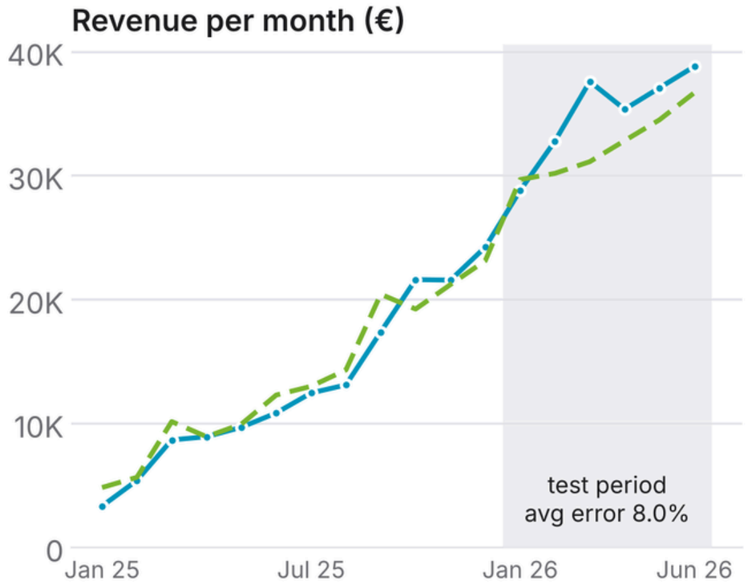

**What did not change:** trial → paid stayed between 32% and 43% all period. **What is getting weaker:** the referral loop, from 17 to 6.5 referrals per 100 subscribers a month.

# A model calibrated on 2025 predicts the 2026 it never saw

Spend → Signups → **Activation** → Trial → Paid → Churn → Revenue

Paid channels: signups = a · spend^b (Meta b = 0.65, TikTok 0.85, Google 0.94: diminishing returns). Organic: trend + Jan/Sep peaks. Referral: 4.1 signups per 100 active subscribers (the loop).

**Average error on Jan–Jun 2026 (test)**

**4.5%** Signups

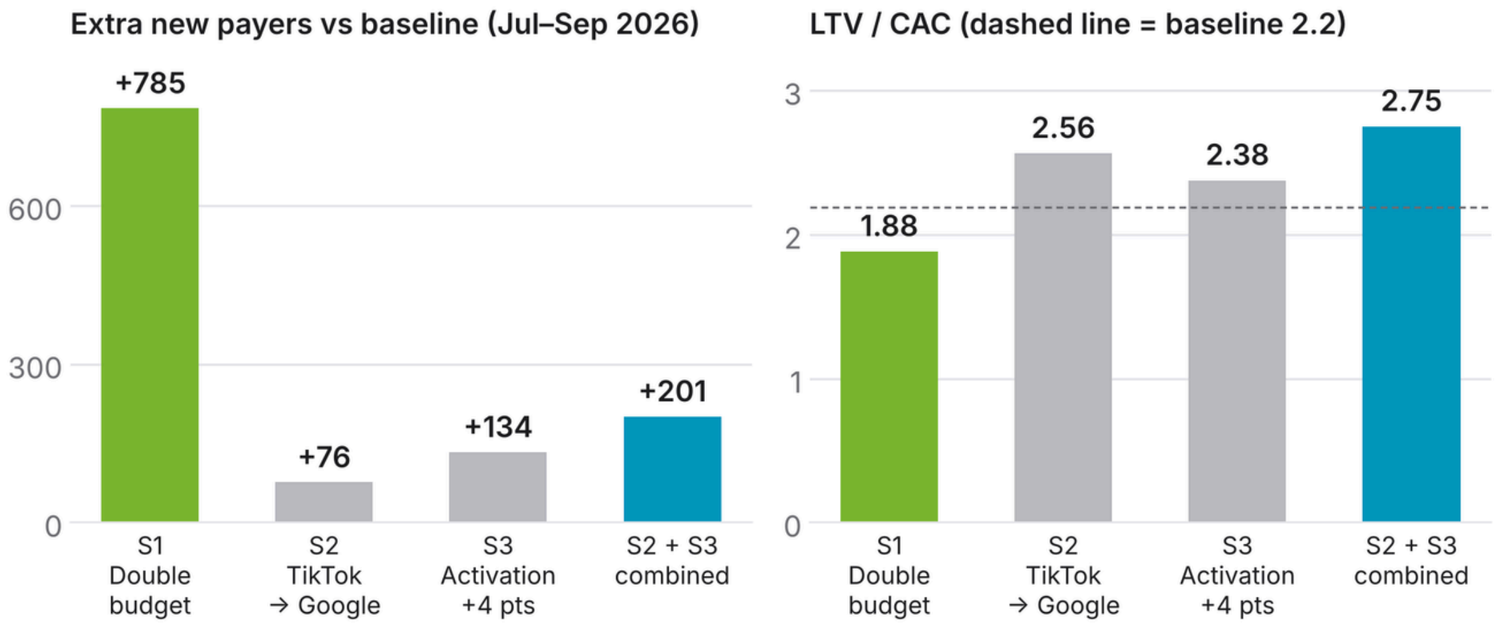

**6.2%** Active subscribers

**8.0%** Revenue

**13.1%** New payers

Always slightly too low, so the model is conservative. Good enough to compare scenarios.

# Doubling the budget buys the most payers at the worst price

S1 and S2 push Meta (~€20k/month) and Google (~€6.7k/month) beyond any spend observed, so these results extend the curves. S3 does not include the cost of building the onboarding change.

**Baseline:** €50k per quarter, 1,732 new payers, CAC €46, LTV/CAC 2.2

## €64

**Per extra payer if we double**

vs €46 today: 60% of the extra money goes to Meta

## €3.43 vs €1.25

**Value of the next €1**

In Google vs in Meta, over the payers' lifetime

**S2 + S3:** +201 payers, €0 extra spend, LTV/CAC 2.75

# Where the next euro should go

**01** **Don't double the budget with the same mix**

Each extra euro would bring back only €1.59.

**02** **Move TikTok's budget to Google Ads**

Then add to Google in steps: we have never seen it above €4,280 a month.

**03** **Invest in the first week**

Help new users reach their 3rd workout; it worked in every channel on 1 Oct 2025.

**04** **Test a referral reward**

Referral users pay most and stay longest, but the loop is weakening.

A/B test · onboarding

## Does a guided first week raise activation?

New signups split 50/50 for 4 weeks (about 1,200 a week). Main metric: 3 workouts in 7 days, baseline 40%. Detects +3.9 points (5% significance, 80% power). Then check trial → paid.

North Star Metric

## New users who complete 3 workouts in their first 7 days

Moves with payers (correlation 0.997 vs 0.908 for signups), known after 7 days, and cheap signups can't inflate it. Watched together with monthly churn.
